Worksheet 13 on Exact ODEs

1. Show that the ODE $\Big(y^2 + \cos(x)\Big)dx + 2xy\,dy = 0$ is exact.

2. That is, the ODE is really $dF := \frac{\partial F}{\partial x}dx + \frac{\partial F}{\partial x}dx = 0$ in disguise, and the general solution is $F(x, y) = C$.

Write down the two facts you know about F:

I. $\dfrac{\partial F}{\partial x} =$ _____ and II. $\dfrac{\partial F}{\partial y} =$ _____.

Method A: We obtain the formula for $F(x, y)$ by finding 2 antiderivatives (that is, by doing 2 "partial integrals" with functions replacing the "$+C$"), and finding an $F(x, y)$ that satisfies both expressions.

Equation I says that $F(x, y) =$ $\qquad\qquad +g(y)$

Equation II says that $F(x, y) =$ $\qquad\qquad +h(x)$

One choice of F, with no arbitrary constant, is $F(x, y) =$

Thus, the general solution to the ODE is

Also do method B: Take the expression for $F(x, y)$ with the $g(y)$ obtained from equation I and plug it into Equation II. Then solve for $g(y)$, which involves an arbitrary constant. Finally, get the formula for $F(x, y)$.
